Abstract

The International Dysphagia Diet Standardisation Initiative (IDDSI) global framework was launched in November 2015. It was subsequently adopted by the Royal College of Speech and Language Therapists and the British Dietetic Association following expert review and professional membership consultation. In the UK, NHS England established an External IDDSI Reference Group comprising of stakeholders including professional, catering, industry and manufacturing representatives.

The IDDSI External reference Group have endorsed a UK Aware, Prepare, Adopt model of implementation and all manufacturers and all healthcare settings are anticipated to be fully IDDSI compliant by April 2019. This requires whole system change with a comprehensive training programme. Those providing and delivering food and drink to individuals with swallowing difficulties need to familiarise themselves with food and drink consistencies and their testing methods. Resources are available to assist local healthcare institutions with implementation of the framework at www.rcslt.org / www.bda.org / www.iddsi.org.

Introduction

Dysphagia (swallowing difficulty) is estimated to affect 8% (590 million) of the world's population (Cichero et al. 2017), with 5.2 million people presenting with difficulties in the UK. Swallowing is a complex neuromuscular process that involves cessation of breathing in order for food and fluid to move through the throat and into the oesophagus. As such, dysphagia is a common clinical symptom in many congenital and acquired conditions (Takizawa et al. 2016; Falsetti et al. 2009), with difficulties evident at each of the pre-oral, oral, oral transit, pharyngeal and oesophageal stages of the swallow. There is evidence that the early identification and management of individuals with swallowing difficulties, especially following stroke, plays a fundamental role in reducing the risk of malnutrition (Carrion et al. 2017), pneumonia (Bray et al. 2016; Palli et al. 2017), poor individual outcome (Turner et al. 2015; Middleton et al. 2011), mortality (Ingleman et al. 2011; Koennecke et al. 2011), and costs (Katzan et al. 2007). The health risk to individuals with swallowing difficulties is often compounded by impaired physical and cognitive function, which may impact further on the eating process. Decreased levels of alertness, fatigue, inability to maintain trunk and head alignment, reduced postural stability and tone, limb and body apraxia, visual perceptual difficulties, communication problems, a lack of insight, depression and poor oral hygiene (Boaden et al. 2017), can all affect eating, drinking and swallowing of food, fluids and medication.

There are a number of strategies that assist in the safety and efficiency of swallowing. However, some individuals with swallowing difficulties have insufficient cognition to implement the strategies throughout the day. Consequently, the modification of drink and food is a common compensatory strategy (Steele et al. 2015), which is effective in terms of reducing the risk of aspiration of food and drink into the airway (Newman et al. 2016). The main finding from a systematic review showed that there is evidence that increasing bolus viscosity with modified starch and/or xanthan gum thickeners improve the safety of swallowing in oropharyngeal dysphagia by variation in swallow physiology (Park et al. 2017; Garand et al. 2016; Jestrovic et al. 2016; Steele et al. 2015) and compensatory mechanisms (Vilardell et al. 2016).

This reduction in the risk of aspirated material into the trachea may reduce the incidence of aspiration pneumonia, death and dependency. More recently, research has identified that not only is it important to deliver drinks that are thickened to prevent thin fluids being aspirated onto the lungs, but it is as important to ensure that drinks are not too thick. Newman and colleagues report that increasing consistency may result in post swallow residue (Newman et al. 2016) above the airway, which if not removed by clearing swallows or wash down techniques may be aspirated onto the lungs. Furthermore, the thicker the consistency, the less palatable it becomes to individuals and the incidence of non-compliance increases. It is therefore essential that the person receives the consistency prescribed. For individuals who have chewing difficulties, solid foods may also need to be modified.

UK Dysphagia Diet and Food Texture Descriptors and the International Dysphagia Diet Standardisation Initiative

Many of the prescribed foods and fluids provided to individuals with swallowing difficulties align with the UK Dysphagia Diet and Food Texture Descriptors (NPSA, RCSLT, NACC, BDA, NNNG, Hospital Catering Association 2011) and the National Descriptors for Texture Modification in Adults (BDA 2009). These frameworks were adopted by the Royal College of Speech and Language Therapists (RCSLT) and the British Dietetic Association (BDA). However, different food and fluid descriptors and frameworks continued to be used (Boaden 2011). This scenario of variation in the delivery of food and fluid consistencies is replicated between and within other primary and secondary health care settings and institutions. Non-standardisation of oral intake consistency descriptors may affect the quality of care offered to individuals with swallowing difficulties and precipitate aspiration pneumonia, a common and preventable consequence of dysphagia.

Therefore, there is a need for a framework to offer an international standardisation for consistency management. The International Dysphagia Diet Standardisation Initiative (IDDSI 2017) was launched in November 2015. It consists of a continuum of eight levels, from normal fluids to normal diet. It provides culturally sensitive colour codes and neutral terminology and definitions for texture modified

food and fluids. It includes evidence for descriptors and testing methods for both drink thickness and food texture levels. (For full details on the framework visit webpage <https://iddsi.org/Documents/IDDSIFramework-CompleteFramework.pdf>)

Adoption

To date, adoption of the IDDSI framework globally is ongoing. In the UK, NHS England established an external IDDSI reference group comprising of stakeholders including professional, catering, industry and manufacturing representatives. Concurrently the RCSLT and the BDA have undertaken programmes of work. They independently established expert reference groups and following a recommendation from the respective professional groups and a period of consultation with their membership, these professional bodies independently and formally announced adoption the new IDDSI framework in 2017. These groups have devised a series of resources in order to facilitate

implementation of the framework at a local level that are available from their respective websites: www.rcslt.org and www.bda.uk.com.

Roll out

There has been a published article regarding implementation of the IDDSI framework (Lam et al. 2017). However, the study was undertaken in one discrete hospital where a standardised terminology framework for fluids and food was not already utilised. In the UK, whole system change is required to deliver consistent training and accurate terminology and communication across primary and secondary care as well as educational settings, the NHS, private and voluntary facilities.

The External Reference Group have identified a UK 'Aware, Prepare, Adopt' model of implementation and all manufacturers and all healthcare settings are anticipated to be fully IDDSI compliant by April 2019. As part of the 'Aware' strategy, many organisations have issued safety alerts and established interdisciplinary strategic steering groups to oversee implementation. A timeline and plan for rollout is fundamental to the 'Prepare' strategy, with communication between healthcare staff and manufacturers of food and drink working together for successful implementation of the framework. Identified IDDSI champions and co-ordinators need to meet frequently to ensure momentum. Consideration needs to be given to training all staff e.g. community staff, GPs, pharmacists and carers within the locality who deliver modified food and fluids across all wards, care homes, educational establishments and day centres and in individual's homes.

Warning

Familiarity with and consistency of use of terminology needs to be ensured in order to avoid confusion with previous terminology and any risk to delivery of health care. More recently NHS improvement have issued a safety (NHS Improvement 2018) alert prohibiting the term 'soft' in reference to food consistency and diet. This is in response to individual healthcare staff and carer's interpretation of the term leading to incorrect diet being taken with consequential choking and death. This further enforces the need to use accurate terminology when communicating about diet and fluid modification.

Catering departments need to revise menus and industry partners need to ensure that their products: thickening powder; supplements; modified meals; and their product information leaflets align with the NHS Improvement Safety Alert and the new IDDSI consistency framework. For many establishments who use a variety of manufacturing products, where change over to the new IDDSI framework is staggered, extra vigilance is required to ensure a successful 'Adopt' strategy by April 2019.

Training

Healthcare staff may feel confident in the recognition of different food consistencies. However, food and drink consistencies are now determined by specific descriptors and testing methods. An overview of the food and drink descriptors and their testing methods is offered but staff must be familiar with all the details regarding the food and drink descriptors and testing methods for each consistency. Visit webpage <https://iddsi.org/Documents/IDDSIFramework-CompleteFramework.pdf>

Food levels 7-4 descriptors and testing methods

Staff should be aware of the introduction and classification of a new category of food consistencies termed 'transitional foods'. These products alter their consistency, typically in response to heat and/or moisture. They may therefore change from the prescribed consistency prior to delivery to the individual or within the oral cavity prior to swallowing e.g. ice cream, bread, wafers etcetera. Level 7 Regular includes all foods textures and may be various sizes. More recently, 'Easy to chew' foods have been recognised and subsumed within the Level 7 Regular for individuals who might benefit from foods that do not require a particular particle size to be identified. Level 6 Soft and Bite-Sized should be moist and tender and are required to be an appropriate size for oral processing skills i.e. 1.5cm for adults and 8mm for paediatrics, to prevent solid foods being lodged in the trachea and prevent choking. Similarly, Level 5 Minced and Moist consistencies are required to have no separate thin liquid and have small lumps visible (4mm for adults and 2mm for paediatrics) that are easily squashed with the tongue. Level 4 Pureed should have no lumps and should not be sticky and should fall off a spoon when tilted. Level 3 Liquidised foods should be a smooth texture with no bits and may be drunk from a cup.

Similarly, healthcare staff will need to be familiar with specific testing methods for food i.e. the fork pressure test and the spoon pressure tests for Level 6; the fork prong test for Level 5; the spoon tilt test for Level 5 and Level 4; and the fork drip test for Level 3.

Drink levels 4-0 descriptors and testing methods

There are new levels defined for modified drinks (Levels 4 – 0). Level 4 Extremely Thick drinks cannot be drunk from a cup and may be piped or moulded. It has no lumps, is not sticky and liquid does not separate from the solid. Level 3 Moderately Thick drinks have a smooth texture, with no bits and may be drunk from a cup. Level 2 Mildly Thick will flow off a spoon, whilst Level 1 Slightly Thick drinks will flow through a straw.

The spoon tilt test may be used for Level 4 Extremely Thick and the fork drip test has been identified for use with Level 3 Moderately Thick drinks. The syringe flow test has been devised to test for levels 4-0.

The IDDSI framework uses a syringe flow test using syringes with a measured length of 61.5 mm from the zero to the 10 mL line (BDTM syringes were used for testing of the IDDSI framework, manufacturer code 301604).

Figure 2. Flow Test: residue in syringe after 10 seconds equates to the fluid consistency levels within the IDDSI Framework.

The viscosity of fluid consistencies is dependent on many variables including the time taken to thicken fluids (Kim and Yoo, 2015) and the temperature of the modified drinks (Cola et al. 2012). It is therefore important that healthcare staff have a working knowledge of how to make, test and deliver individually prescribed consistencies of drinks.

The IDDSI website has literature and videos that healthcare staff can make themselves familiar with. IDDSI suggest that using the syringe flow test might be useful to use during training but do not anticipate that it will be used to test every drink given in clinical practice.

Readers are advised to engage in local plans for IDDSI implementation and familiarise themselves with resources available from the following websites; www.rcslt.org; www.bda.uk.com; www.iddsi.org.

Key points: You must supply 4–6 full sentences that adequately summarise the major themes of your article.

The International Dysphagia Diet Standardisation Initiative (IDDSI) framework has been adopted by the Royal College of Speech and Language Therapists and the British Dietetic Association.

Catering, industry and manufacturers of food and fluid consistencies that provide services to individuals with swallowing difficulties need to be compliant with the new framework and change instructions for use by April 2019.

All healthcare and educational institutions will be required to implement the framework by April 2019.

All healthcare staff need to make themselves aware and understand the IDDSI framework to ensure they deliver the correct consistency and therefore eliminate the risk to individuals who have swallowing difficulties in the transition period to the IDDSI framework.

Resources are available to assist local healthcare institutions with implementation of the framework at www.rcslt.org / www.bda.org / www.iddsi.org.

Reflective questions: Please supply 3–5 questions based on your article that readers can use for reflective notes or discussion, which may be used to count towards their NMC revalidation. These should be open-ended questions.

Why is there a need to implement a new diet and fluid framework?

How can you ensure that you are familiar with all food, fluid and medications in a format that reflects the IDDSI framework?

What teams within your organisation would you access or engage with in order to be able to deliver all food, fluid and medications in a format that reflects the IDDSI framework?
